

Multiple Imputation in Mplus produces a new column of results called "rate of missing". This is the same as fraction of missing information.

Mplus uses Schafer's rate of missing information (see formula 2):

<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC4934387/>

Another formula is $FMI = V_b/V_t$, where V_b is between-imputation parameter variance, and V_t is total parameter variance (this definition is in Bodner 2008, Schafer 1997, Enders 2010).

The two formulas usually agree very well.
